**N. C. Agricultural Extension Service Recommendations for Increasing Corn Yields**

1. Have the soil tested and apply lime as recommended.
2. Prepare a good seedbed and plant level with the ground except where drainage is poor.
3. Use 300-500 lbs. of 6-8-6 or 4-8-8 at planting. Use the higher rates following crops receiving low amount of fertilizer and the 4-8-6 on potash deficient soils or following legumes for hay.
4. Avoid late, deep cultivation but control weeds early. Use a weeder where available as it is six inches high. Cultivate shallow until the corn is 2½ feet high, and then stop cultivation. Do not use turning plow or bull tine. Do not injure corn roots.
5. Place rows about 3½ feet apart.
6. Space plants about 16-20 inches apart within the row, using wider spacing for less fertile soils.
7. Sidedress with adequate nitrogen (potash where needed) when corn is 6-8 weeks old or about 2½ feet high. Yield increases of 25-45 bushels per acre may be expected by use of 500 lbs. of Nitrate of Soda, or 400 lbs. of Calnitro or ANL, or from 250 lbs. per acre of ammonium Nitrate. One-fourth of this rate of application should give yield increases of 10-12 bushels per acre above similar corn receiving no sidedressing.

Plantings may be made from early spring until mid-June and again in the early fall.

VEGETABLE PLANTING CALENDAR

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardiness of a number of the most popular and productive vegetables. By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (salad or root) can be kept in production, out-of-doors and without protection winter or summer, every day in the year in this isothermal zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years.

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe dates to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

"TESTED SEEDS"

The term "tested seeds" as used in this catalogue, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied by a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

WYATT’S POTASH FED DAHLIAS
WE LIST ONLY THE VERY FINEST DAHLIAS FOR SOUTHERN CULTURE

CULTURE—Dahlias thrive best in a sunny location. Work the soil to a depth of 8 inches and pulverize thoroughly, mixing with it dry sheep manure. Plant the bulbs, about 6 inches deep, laid flat with the eye up and cover with 2 inches of soil, filling in as the plants develop. For the last two buds, leave only the terminal bud of a single stem plant, pinching off all other buds as they appear, clear to the ground. For 4 to 6 fine, large flowers per plant, pinch out the top of plant, leaving 2 or 3 pairs of leaves. Water copiously.

IPOMEAS. In growing Ipomeas (Morning Glories and Moonflowers), never plant until the soil is thoroughly warm. To aid germination of particularly hard-seeded varieties, filing a small nick at the top of the seed will help considerably. Always select the daintiest, sandiest part of the garden and sow where the plants are to flower as the Ipomeas resent transplanting. Plants should be kept on the dry side in order to induce early and abundant flowering with a rather sparse growth of foliage. Heavy watering will stimulate foliage growth at the expense of flowers. A poor soil is preferable to a rich one and fertilizer should not be used as this will promote heavy foliage which will hide the flowers.

1805 Pearly Gates. It is exception- ally free flowering with large showy pure white flowers making a heavy cascade of flowers on fence or trellis. One of the earliest bloomers. Pearly Gates received Special Mention in the 1842 ALL-AMERICA Selections. Pkt. 10c; 1/4 oz.

While the flowers are not quite so large as the heavy glories, Morning Glories they are of good size, 3 to 4 inches in diameter freely produced on fast growing vines that bloom 65 to 70 days after seeds are sown. The dark green foliage does not make a heavy growth, leaving the plant in fine appearance. Easiest culture. Pkt. 10c; 1/4 oz. 40c.

1809 HEAVENLY BLUE. A graceful vine of extremely quick growth producing a great number of exceptionally formed deep blue petunia-like flowers. Ideal for covering stumps or other unsightly objects. Pkt. 10c; 1/4 oz. 35c; oz. $1.00.

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

BRIEF CULTURE NOTES

ZINNIAS: Zinnias are warm weather loving plants and should never be sown until the soil has thoroughly warmed up and all danger of any frost has passed. For best results, especially with the smaller flowered, early blooming varieties, we recommend sowing the seed where the plants are to flower. The taller growing, large flowered sorts can safely be transplanted after the first danger of frost is past. Sow a little trench alongside the row and let the water run slowly for several hours so it will seep down deep into the ground and make the soil in the area available for the plant throughout the mass of feeding roots. Always cultivate after each irrigation to conserve moisture. By this method you will have to water Zinnias only once every two weeks or so, whereas if the ground is merely sprinkled you will have to repeat the sprinkling every other day or so. Irrigation not only gives a stronger, healthier plant, but also saves on your water bill.
Everybody wants Perennials—and wants them in generous measure to secure the desired effects in color and charm. If you delay and finally buy plants, the cost may be high; an attractive perennial border may require several hundred dollars worth of seeds! Aside from the money saved it is very fascinating to grow your own plants from seed.

WYATT’S GARDEN LILIES

Plant 6 to 10 inches deep in a well drained soil, free from manure.

CULTURE: Lilies generally dislike lime, must have ample moisture but must be well drained. Regardless of the depth at which the variety is planted the soil should be deep, rich, loamy and rather gritty than stiff clay. Avoid full sun and too dense shade. The ideal situation for Lilies being in the perennial or shrub border where the lower parts of the plants are shaded while the top of the plants and flowers have access to ample light and air. Avoid ordinary manure which may cause the bulbs to rot. Use Sheep Manure mixed well into the bed.

FERTILIZERS AND SOIL CONDITIONERS

Best of all natural manures, highly concentrated, free from straw and rubbish, with all weed seeds killed. It puts new life into worn out soils.

For lawns use 6 to 10 lbs. to every 100 square feet. For vegetable or flower gardens use 10 to 15 lbs. to every 100 square feet. Prices: 100 lbs. $3.30.

Agricultural BORAX

ES-MIN-EL

(Essential Mineral Element)

ES-MIN-EL is a carefully balanced and easily soluble mixture of mineral elements needed by fruits, vegetables, and field crops for healthy and profuse growth. Many plant diseases traceable to a deficiency of minerals are overcome through use of ES-MIN-EL. These plant diseases were formerly called “physiological diseases,” but we now know they were simply evidences of a lack of minerals. Minerals enable a plant to make the fullest use of all other available plant foods and of water and sunshine. Thoroughly nourished plants mature early; improperly nourished crops have a slow development and so become the prey of insects, disease, drought, and early freezes. Plants in poor health because of mineral deficiency cannot take advantage of even the most abundant supply of fertilizer materials or the most favorable climatic conditions. The increase in crop alone usually justifies the small expense of using ES-MIN-EL.

All fruits, vegetables, and nuts which have received a full supply of the essential mineral elements in ES-MIN-EL have been noted for their fine color, flavor, and texture. To the commercial grower this means improved shipping qualities and ready sale.

ES-MIN-EL should usually be used with a good commercial fertilizer. It may be mixed with the fertilizer or applied as a top dressing. For best results ES-MIN-EL should be applied a second time in mid-season on long growing crops. Don't put ES-MIN-EL too close to seeds or plants.

Fifty pounds of ES-MIN-EL spread broadcast will mineralize one acre; one cupful will mineralize a garden plot 10 feet square. This dosage is recommended for fairly normal soils; it is a maintenance ration of minerals. For poorer soils, larger quantities may be used for advantage. Prices: 5 lb. bags $1.00; 100 lb. bags $8.00; f.o.b. Raleigh.
FIELD SEEDS

F97 Alfalfa (Kansas or Oklahoma Approved)

While Alfalfa is a relatively expensive crop, the first cutting usually returns about double the cost of seeds, lime, fertilizers, and planting. A good method to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed.

Use 20 to 35 pounds (not more) borax per acre and till August 20 to October 1, or February 15 to March 25, 20 to 40 pounds of thoroughly inoculated seeds per acre. Roll or culti-pack after seeding. At seeding time use 600 to 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before 1/2 flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production. We offer 90% pure or better seeds, of adapted origin, germinating 90 per cent or more, free of noxious weeds, as follows:

KANSAS ALFALFA, lb. 60c; 5 lbs. $2.45, postpaid. Not prepaid, 10 lbs. $4.20; 25 lbs. $10.25; 100 lbs. or more at 40c lb. OKLAHOMA APPROVED ALFALFA, lb. 55c; 5 lbs. $1.20, postpaid. Not prepaid, 10 lbs. $3.70; 25 lbs. $9.40; 100 lbs. or more at 35c lb.

BORAX. Prices: 25 lb. bag $2.00; 100 lb. bag $6.00.

F95 Sericea Lespedeza

Sacrificed and reclassed. This is the perennial lespedeza being grown so largely over the south. Its greatest asset is that it grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices: Lb. 45c; 5 lbs. $1.85, postpaid. Not prepaid, 10 lbs. $3.20; 50 lbs. $15.50; 100 lbs. or more at 29c lb.

A complete recovery after grazing often takes place in two weeks. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed, fertile and somewhat moist land. Sow 5 to 6 pounds per acre alone or 1 to 3 pounds in mixtures. Prices: Lb. $2.85; 5 lbs. $14.00, postpaid. Not prepaid, 5 lbs. $13.80; 25 lbs. $68.75; 100 lbs. or more at $2.70 lb.

Write for quantity prices.

F92 Korean Lespedeza

Growing on any soil, wet or dry, rich or poor, sour or sweet. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. A good stand will make one ton of hay per acre for each 4 to 5 inches above cutter bar. Korean Lespedeza is earlier than other lespedezas, this insures harvest before fall rains and early frost and gives time for seed bed preparation for small grain that fall. Sow 30 pounds of seed per acre February to April. Prices: 100 lb. bag $18.00. Write for quantity prices.

SOY BEANS

CULTURE: Soy beans may be planted either broadcast or in drills. They grow equally well on light and heavy soils, but on heavy soils they should not be planted more than 1 to 1½ inches deep except in dry season. On light sandy soils plant deeper, but not more than 3 inches. Plant in April, May or June. Such large seeded varieties as Mammoth Yellow require 1 bushel or more per acre, whereas Laredo small seeded kind only require 1 peck to the acre.

F146 Ogden This variety is worthy of consideration and comparison for several reasons. During recent years in the trials conducted by the North Carolina State College Experiment Station it has ranked at or near the top in yield of beans, oil content of the beans, yield of hay and resistance to shattering. In addition Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seeding as late as June in the Wake County trials made a substantial production of hay. Average bean yield for 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Write for prices.

F150 Volstate A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we would recommend Ogdens, but for a crop planted on light land and for combining we would recommend the Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Tennessee Certified Seeds (packed 2 bushels). Write for prices.

F151 Virginia It is about twenty days earlier than Mammoth Yellow. The vines make a fine growth, are filled with pods, stand about three feet high, are easy to cut and easy to cure. Prices: 2 bu. bags $6.00 per bu.

F140 Wood’s Yellow A strong upright growing plant producing a heavy crop of beans. This variety is suitable for sowing thick for hay, or planting alone or with corn for grazing. One of the best varieties for bean production and the beans are readily accepted at the crushing mills. Late maturing. Packed 2 bushels. Write for prices.

F147 Tokio A heavy producer of extra-large pods and beans. Packed 2 bushels. Write for prices.

F142 Otootan Its late maturity is more than overcome by the abundant growth—five feet and more in long season—five stems and abundant foliage, and the fine texture of its hay. It is a very good variety of hay, 1 peck per acre. Write for prices.

F152 Laredo A bean of outstanding worth, particularly for making hay. In a six-year test it averaged 1½ tons to the acre. It is medium in maturity, a good yielder of beans, 1 peck per acre. Write for prices.

F141 Roanoke A new bean developed in the N. C. Experiment Station, U.S.D.A. Co-operative operations. Beans yield is higher than other popular varieties and the oil content of the beans is higher. Write for prices.

STOCK PEAS

Owing to the present situation with respect to farm labor the supplies of peas, especially pure varieties, are extremely short.

F101 Brabham The seeds are smaller and do not require to be seeded as thickly as other kinds. It is disease-resistant, vigorous in growth, holds its foliage well, valuable for hay. Prices: 5 lbs. $1.50, 10 lbs. $2.00, 25 lbs. $5.00, 100 lbs. $10.00.

F109 Whippoorwill More largely grown than any other cowpea, probably because of its long vine, usually six feet long, and large yield of both hay and peas. Write for prices.

F111 Black Very prolific, early to mature, makes a fine growth. Write for prices.

F103 Large Black-Eye The pods are long and well filled with large, pure white peas with a coal-black eye. Prices: ¼ lb. 30c; ½ lb. 50c; 1 lb. $1.00, 5 lbs. $4.50, postpaid. Not prepaid, 15 lbs. (peck) $3.00; 60 lbs. (bu.) $10.00.

F304 Crotalaria, Giant Striata
**SORGHUM - MILLET - MILO - TEOSINTE**

**F296 Plainsman (Combine) Milo**
A superior plant for growing with peas for hay because of its low habit of growth. For grain it out yields corn and brings a higher price. Dry grain is ready in 110 to 120 days. Ready to cut for hay in 60 days. Plant 10 lbs. per acre in rows; broadcast 25 lbs. with peas or 50 lbs. alone. Prices: Lb. 30c; 5 lbs. 85c, postpaid. **F197 Hegari**
Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Seed grain has great forage value for two reasons. First, because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: Lb. 30c; 5 lbs. 85c, postpaid. Not prepaid, 10 lbs. $1.15; 25 lbs. $2.50; 100 lbs. or more at 9c lb.

CULTURE: Soil: Well drained sandy loam, properly limed, is best. Varieties: Virginia Bunch and Jumbo Runners in the old belt of North Carolina and Virginia. Spanish, North Carolina Runner or Virginia Bunch in the Southern Coastal plains and counties bordering the Piedmont using Spanish, Tennessee Red, North Carolina Runner if it is doubt as to the ability of the soil to make the large yields. In the Piedmont the Spanish variety is recommended. Smaller varieties produce more oil and larger nuts. Produce one or two dozen, or adapt soils and use the larger nuts produce more oil per acre. Use 25 lbs. small varieties; 45 lbs. large varieties (shelled) per acre. Buy 1-3 more nuts by weight in the shell for the desired amount of shelled nuts. Field tests show 27 per cent increase in yield when seeds are treated with Arasan. Average of 22 tests conducted in North Carolina showed $16.43 per acre increase return when peanuts were dusted 4 times with sulphur-copper dust, after deducting the cost of dusting.

**F254 Tobacco, Oxford 26, Granville Wilt Resistant**

Our Oxford 26 tobacco seeds are produced on soils known to contain the wilt spores and the crop is interplanted every tenth row with a standard variety. Note the effect of the wilt on the non-resistant variety in the center row in the picture above, and the uniform stand of Oxford 26 in the next rows.

**F254 Oxford 26 Certified** This is the variety resistant to Granville wilt, offered for the first time for planting in 1945. Granville Wilt is widespread in Granville, Wake, Durham, Pitt, Carteret, and Craven counties but is present on at least a few farms in nearly every North Carolina county where flue-cured tobacco is grown. In general appearance Granville wilt is similar to other diseases that attack the crop, but in mid-summer can be easily distinguished by the presence of dark streaks which extend for 1 to 2 inches above the wilt line in the woody part of the stem. Oxford 26 is recommended only for fields known to be contaminated with Granville wilt. This strain is highly resistant, but for best results should be grown on soil rotated to other crops for 1 to 2 years. By comparison this variety will not produce the weight of leaf per acre that can be expected from 400 or 401, but the yield would compare favorably with such standard varieties as Gold Dollar, White Stemmed Orinoco or Cash. Because the leaves are spaced somewhat farther apart than on some varieties, it can be planted closer together in the row for increased yield. The quality compares favorably with other varieties. Oxford 26 is produced directly from seeds supplied by the Oxford Experiment Station where this variety was developed. Our seeds are chemically treated. Prices: Oz. $2.00; 3 ozs. $5.55; lb. $56.00, postpaid.

**F279 Oxford No. 1** Resistant to Black Shank, a disease that attacks the larger roots and stalks, causing death rapidly. Oxford 1 is the least resistant but the best quality of the resistant varieties. For best results plant on soils that have been planted to crops other than tobacco for at least 2 years. Recommended only for fields where black Shank is known to be present. Prices: Oz. $1.00; 3 ozs. $2.65; lb. $13.00, postpaid.

**F271 Bottoms Special** Prices: Oz. $1.00; 3 ozs. $2.65; lb. $13.00, postpaid.

PLANT JR. TOOLS

You cannot afford to till the ground without Planet Jr. tools. They not only save hard labor, but enable you to cultivate double the acreage in the same time, and thus add over 100 per cent to your crop yield. Invented by a practical farmer and manufacturer—the result of fifty years' experience. Strong lasting construction. Fully guaranteed.

**NO. 4—COMBINED HILL AND DRILL SEEDER AND SINGLE WHEEL HOE**

The small grower should select one of the combined machines. The drill attachment will not be used as often as the hoeing and cultivating tools, but will be a source of much saving. This machine is a special favorite. There are probably more of them in use in the world than any other seeder made. As a Hill and Drill Seeder it opens the furrow, deposits the seed, covers it and rolls it, either in drills or hills. Holds 2 1/2 quarts. Price: $33.40.

No. 4-D. Seeder only, no cultivating attachments. Price: $20.30.

**NO. 12—DOUBLE AND SINGLE WHEEL HOE COMBINED**

No. 12 Planet Jr. Double Wheel Hoe

The arch is high enough to straddle a row until plants are 20 inches high; this insures close work. It can be altered into an admirable single wheel hoe for working between rows. Price: $15.70.

Send for Complete Planet Jr. Catalog

**NO. 16—SINGLE WHEEL HOE**

No. 16 Planet Jr. Single Wheel Hoe

Designed to do all work required in the small garden: plowing, cultivating, hoeing and raking. It is very light, and can therefore be easily carried about. Price: $12.40.

**NO. 19-R—SINGLE WHEEL HOE**

A medium priced wheel hoe with all the attachments necessary for cultivating a small garden. Price: $8.00.

**NO. 220—PLANET JR. FERTILIZER DRILL**

Price: $38.00

The No. 220 will distribute fertilizer in the middles of three rows 12 to 14 inches apart; it will side-dress one side each of two rows up to 36 inches apart (one complete row; and corn in wider rows). You can use it in very narrow rows—as close as 6 inches. You can use it in 42 to 48 inch rows by closing off the drill in three spouts and distributing through the other three—either on the right or left hand side.

No. 220 will distribute fertilizer from 4 to 30 inches on the ground. The hopper capacity is one bushel and the weight of the load is placed over the wheels, making it easy to push. The No. 220 will distribute 100 to 2,000 pounds of commercial fertilizer to the acre. Quantity per acre is regulated by the adjustable index on the right hand handle. The shut-off rod is operated from the same point.

**NO. 9—PLANET JR. HORSE HOE AND CULTIVATOR**

No. 4 Planet Jr. Combined Hill and Drill Seeder and Single Wheel Hoe

Weight 70 lbs.
Price: $18.75

These Planet Jr. Horse Hoes and Cultivators are stronger, better made and finished than any other one-horse cultivators, and enable you to increase your yield, because they do a greater variety of work in corn, potatoes, cotton, beans, tobacco and other crops requiring similar cultivation, and do it more thoroughly. Cultivate deep or shallow, in different width rows, and the extra long frames make them steady running. All Planet Jr. cultivator steels are made of beveled steel thickest down the center, making them self-sharpening, and the points retain their shape and strength. No. 9 has lever expander, allowing quick adjustment for different width rows. Used with or without a wheel.

**NO. 4-D—PLANET JR. PLAIN CULTIVATOR**

Weight 49 lbs.
Price: $11.50

This tool is strong and simple. It has patent handle braces; very firm, simple and convenient. With them the frame and handles seem almost like one solid piece. Changes in width are quickly made by loosening one nut on each side, and one side may be opened wide while the other is closed. An everyday all-day tool.

**NO. 100-D—PLANET JR. PLAIN CULTIVATOR**

Price: $10.00
Weight 42 lbs.

We offer this Cultivator with the object of filling a definite need where lands are light or where farming is done on a modest scale. It weighs but 42 pounds. It will stand hard usage and do excellent work. A steady running tool and easy to handle and adjust.

**NO. 90—PLANET JR. TWELVE-TOOTH HARROW, CULTIVATOR AND PULVERIZER**

Price, complete with steel wheel, $22.40
Weight, packed, 74 lbs.

This tool is a special favorite with strawberry, tobacco and sugar beet growers, market gardeners and farmers, because of its twelve chisel-shaped teeth. The teeth and pulverizer leave the ground in fine condition. Cultivates any width from 12 to 32 inches.

No. 90-D. Without pulverizer, $18.75.
No. 90-D. Without pulverizer and wheel, $14.85.
No. 92-D. Without pulverizer, wheel or lever, $13.25.

Wyatt's Lawn Grass Seeds

A smooth green lawn is your home's greatest beauty asset. Deep, thorough preparation, proper fertilization and good seed are the most important steps toward a successful lawn. Read "10 Steps in Lawn Building," then select the mixture below, most suited to your needs. The results will please you.

Wyatt's Carolina Lawn Grass Mixture

F-60. WYATT'S CAROLINA MIXTURE of lawn grass seeds is an improvement on all the better mixtures offered hereafter at comparative prices. Our constant experiments have taught us just what grasses are best suited to the eastern and southern states. The finest seeds of these varieties are carefully selected and blended into our Carolina Mixture so as to give the very best results obtainable. Sow 6 lbs. per 1000 sq. ft. Prices: 1 to 4 lbs., 50c per lb.; 5 to 24 lbs., 45c per lb.; 25 to 99 lbs., 42c per lb.; 100 lbs. or more at 40c per lb., delivered.

Wyatt's Colonial Lawn Grass Mixture

F-58. WYATT'S COLONIAL MIXTURE. The continued demand for a mixture of the finer leaved grasses has led us to prepare this Colonial Mixture consisting largely of the best varieties of bents and fescues. While the price per pound is higher, only a fraction of the quantity required of other grasses is required of the Colonial Mixture, leaving very little, if any, difference in the total cost far seeding. Once the lawn is seeded to those grasses of vastly superior beauty, all other varieties will be discarded. Use 3 lbs. per 1000 sq. ft. Prices: 1 to 4 lbs., $1.10 per lb.; 3 to 24 lbs., $1.00 per lb.; 25 to 99 lbs., $0.95 per lb.; 100 lbs., or more at 90c per lb., delivered.

Wyatt's Sunny South Lawn Grass Mixture

F-59. WYATT'S SUNNY SOUTH MIXTURE. For lighter soils and soils that become extremely dry, and in locations subjected to extreme heat during the summer months Wyatt's Sunny South Mixture of lawn grasses is recommended. The grass varieties used on golf greens over the entire South predominate in this mixture. Only the purest stocks are used. Sow 6 lbs. per 1000 sq. ft. Prices: 1 to 4 lbs., 60c per lb.; 5 to 24 lbs., 55c per lb.; 25 to 99 lbs., 52c per lb.; 100 lbs., or more at 50c per lb., delivered.

Wyatt's Shady Nook Lawn Grass Mixture

F-61. WYATT'S SHADY NOOK LAWN GRASS. A carefully blended mixture of grasses best adapted to shaded situations. Use 6 lbs. per 1000 sq. ft. Where the soil is acid from poor drainage or leaching from trees, occasional application of agricultural lime should be made at the rate of 5 lbs. per 100 sq. feet. Prices: 1 to 4 lbs., 75c per lb.; 5 to 24 lbs., 70c per lb.; 25 to 99 lbs., 65c per lb.; 100 lbs., or more at 60c per lb., delivered.

F-49. HIGHLAND BENT. Not recommended for the South. Under favorable soil conditions it produces a grass that is very much like the finest quality of creeping bentgrass. Sow 3 lbs. per 1000 sq. ft. Prices: 1 lb., $1.75; 5 lbs., $0.80, prepaid. Not prepaid, 10 lbs., $15.00; 25 lbs., $35.00; 100 lbs. or more at $1.40 per lb.

For Pasture Grasses and Clovers, see pages 42 and 44.

F-48. BERMUDA. Thrives best on rich, loamy soils but will grow anywhere the soil is not too tightly packed. The surest variety on soils exposed to full sun. Used on all golf greens in the South where it responds beautifully to close clipping and frequent watering and feeding. Sow 4 lbs. per 1000 sq. ft. Prices: 1 lb., 90c; 5 lbs., $3.70, prepaid. Not prepaid, 10 lbs., $6.80; 25 lbs., $16.50; 100 lbs. or more at 64c per lb.

F-37. HULLED BERMUDA. You buy only the fine seed kernel itself in this pure, hulled Bermuda seed. Should be used only after the soil is warm in the spring and because it germinates much quicker it may be sowed later in the summer. Sow 2 lbs. per 1000 sq. ft. Prices: 1 lb., $1.10; 5 lbs., $5.10, prepaid. Not prepaid, 10 lbs., $9.40; 25 lbs., $23.00; 100 lbs. or more at 90c per lb.

F-51. CARPET. Beautiful, dark green, flat growing grass of spreading habit and excellent for the low, moist soils of the coastal areas. Tolerant to shade. Sow 4 lbs. per 1000 sq. ft. Prices: 1 lb., 95c; 5 lbs., $4.20, prepaid. Not prepaid, 10 lbs., $7.60; 25 lbs., $18.50; 100 lbs. or more at 72c per lb.

F-40. KENTUCKY BLUE. Very dark glossy green and remaining green longer than other lawn varieties. Ideal for lawns but requires deep, fertile, alkaline soil. Use lime and 4-12-12 fertilizer regularly. Never cut close during hot, dry seasons. Sow 3 lbs. per 1000 sq. ft. Prices: 1 lb., 85c; 5 lbs., $3.60, prepaid. Not prepaid, 10 lbs., $6.40; 25 lbs., $15.50; 100 lbs. or more at 60c per lb.

F-54. RED CREEPING FESCUE. Best for dense shade. Very fine leaved, dark green grass which, once established, withstands the poor dry soil under trees better than most others. Ten Steps in Lawn Building

1. Break or plow deep, with runsoil or similar plow to prevent burying top soil—then level or grade as needed.
2. Apply the equivalent of 3 heavy, green cover crops or 3 inches weed free manure or both if available.
3. Apply lime as needed up to 50 lbs. per 1000 sq. ft., and fertilizer, 40 lbs. per 1000 sq. ft.
4. Pulverize and smooth surface.
5. Seed 6 lbs. Carolina, Sunny South or Shady Nook, or 3 lbs. Colonial mixture per 1000 sq. ft., between September 1 and March 1.
6. Sow thoroughly but slowly to avoid moving seeds. Keep moist until grass is up. Soak occasionally during dry periods.
7. Mow Bermuda and Rye grasses close and often; Blue grasses and Fescues no closer than 3 inches, nor more often than necessary, particularly during hot, dry seasons.
8. Compost clippings with liberal amount of sand and return to lawn in light application as mulching during summer.
9. Feed at 6 to 8 week intervals from February through November with 20 to 40 lbs. per 1000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1000 sq. ft., sheep manure, or both. Always sprinkle after feeding.
10. Apply additional seeds as needed with regular seedings.
